

What is claimed is:

1. A plasma processing apparatus for processing an object to be processed using a plasma, comprising:

a processing chamber defining a processing cavity
 5 for containing an object to be processed and a process gas therein;

a microwave radiating antenna having a microwave radiating surface for radiating a microwave in order to excite a plasma in the processing cavity; and

10 a dielectric body provided so as to be opposed to the microwave radiating surface;

wherein a distance D between the microwave radiating surface and a surface of the dielectric body facing away from the microwave radiating surface, which
 15 is represented with a wavelength of the microwave being a distance unit, is determined to be in a range satisfying an inequality

$$0.7 \times n/4 \leq D \leq 1.3 \times n/4 \quad (n \text{ being a natural number}).$$

2. A plasma processing apparatus as claimed in claim 1, in which the distance D is determined to be in a range
 20 satisfying an inequality

$$0.7 \times n/2 \leq D \leq 1.3 \times n/2 .$$

3. A plasma processing apparatus as claimed in claim 1, in which the dielectric body is a plate-shaped member
 25 disposed in such a manner that a distance between the

09664376.052301

dielectric plate and the plasma radiating surface is substantially zero, and a thickness d of the dielectric plate represented with the wavelength of the microwave being a distance unit is determined to be in a range satisfying an inequality

$$0.7 \times n/4 \leq d \leq 1.3 \times n/4 \quad (n \text{ being a natural number}).$$

4. A plasma processing apparatus as claimed in claim 3, in which the thickness d is determined to be in a range satisfying an inequality

$$10 \quad 0.7 \times n/2 \leq d \leq 1.3 \times n/2 \quad .$$

5. A plasma processing apparatus as claimed in claim 1, in which

the microwave radiating antenna is a radial line slot antenna having a number of slots formed and distributed in the microwave radiating surface thereof for radiating the microwave, and

a part of the number of slots is closed so as to
uniformize the plasma generated in the processing cavity
in a plane.

20 6. A plasma processing apparatus as claimed in claim
5, in which

the number of the slots are concentrically arranged in the microwave radiating surface, and

one per six or three slots in the peripheral
25 direction of the slots arranged in the outermost
